How to Change default Video Card on Laptop / Notebook / Computer Please see this video. A: Use the following link to download the desired drivers: In case the link is not working, copy and paste the link in the browser of the system in which the desired driver is not yet downloaded. Also read the tutorial on how to change default Video Card on Laptop / Notebook / Computer Q: Questions about data storage: what is the cost and value of a software algorithm? I have been reading lately about the architecture of neural networks and deep learning. One problem that I have encountered is the way data are stored. The basic idea is that the whole data set is stored in a matrix and any subset of the training set is stored in a vector. From what I understand the value of storing the whole matrix is the ability to speed up the calculations. That is to say that the model can "see" all the data at once. My question is: what is the cost of a software algorithm? (cost meaning time, memory, power) A: I will talk about storage costs. But I will warn you that there are also other ways of organizing data. If you need to store some data, you have to consider two things: how fast you need to access it and what size it will be. Accessing data is the time needed to load the data in memory or the time needed to calculate it. In reality, usually you want to both save space and speed up your calculations by reading or calculating parts of your data. Memory Space You need memory because data has to be stored somewhere. You don't want to have a lot of memory space because that makes your calculations slower. You need enough memory space to have your model in RAM, but you don't need to load everything into RAM at the same time. So you have to use an optimal memory space for 2d92ce491b
