FAQ

CCTV Design Tool is a professional software application specialized in calculating the ideal positions for video surveillance cameras. It is able to calculate the focal length for CCTV lens and disk storage space required to save the recorded video in digital surveillance systems. User interface The utility offers support for a comprehensive set of calculation parameters, so the layout looks a bit crowded and overwhelming. It integrates a multi-tabbed GUI that allows you to switch between the field of view & lens focal length panel and network bandwidth and disk space one. You may also appeal to the

help manual in case you want to find out more about the function of dedicated parameter. The tool reveals suggestive graphs and 3D view mode in order to help you visualize the information. Fields of view and lens focal length CCTV Design Tool gives you the possibility to calculate the camera lens focal length and field of view in order to identify the best camera position by tweaking a set of parameters related to distance from camera, camera installation height, field of view (height and width), and camera sensor format. The incorporated 3D camera view panel reveals two floating test objects, with one placed on the specified distance while the other is shown at the bottom of the camera line. In addition, you may add a temporary object

(orange man) and check its relative height. At the bottom of the main window, you can find the man's relative height, which is automatically calculated for two points, more precisely point at the specified distance and at the near border of camera zone. When it comes to exporting options, you are allowed to export data to JPG or BMP file format and copy the drawing to the clipboard so you may paste it into other third-party programs. Working with 2D site plans (maps and floor plans) and 3D views You may zoom in or out of the site plan, modify the grid size, add several test objects (wall, man, car, box), move the selected objects using the drag-and-drop support, and load background images (JPEG, BMP, Visio or AutoCAD). The 3D view mode

enables you to move and rotate the camera, adjust the field of view, as well as zoom in or out of the 3D field. Bandwidth and storage calculations CCTV Design Tool helps you find out the network bandwidth of your CCTV cameras and get the required storage space for video archives by selecting the camera type and altering several parameters related to CCTV installations, namely camera resolution in pixels,

CCTV Design Tool [Latest 2022]

Keyboard Macro is an advanced tool for working with various text documents. It enables you to quickly create macros, enhance the performance of the programs, provide a convenient access to the

commands, and much more. Supported Commands: - Delete the text from the current cursor to the end of the current line - Open the current document in the specified application - Split the current document into the specified number of paragraphs - Paste the text of the current document into the specified area of the document - Apply the formatting and the special characters - Copy the current text and the current formatting into the clipboard - Execute a command in the specified program - Save the current document - Add a comment to the current document - Save the current document with the specified name and in the specified format - Open the specified file in the default program - Compress the specified

file - Delete the specified file - Change the name of the specified file - Repeat the current macro in the specified number of times - Expand the text and insert the specified number of special characters - Execute the specified command in the active window - Execute the specified command in the active window and the current document - Execute the specified command in the active window and the specified file - Execute the specified command in the active window, the specified file and the current document - Execute the specified command in the active window and the specified file and document - Execute the specified command in the active window, the specified file and the current document - Execute the

specified command in the active window, the specified file, the current document and the clipboard - Execute the specified command in the active window, the specified file, the clipboard and the current document - Execute the specified command in the active window, the clipboard, the current document and the specified file - Execute the specified command in the active window, the clipboard, the current document and the specified file - Execute the specified command in the active window, the clipboard, the current document and the specified file - Display the specified file - Execute the specified

command in the active window, the clipboard, the current document and the specified file - Display the specified file - Execute the specified command in the active window, the clipboard, the current document and the specified file - Execute the specified command in the active
