given capacities and pressures is critical to the competitiveness of new materials technologies. In this work, we demonstrate the applicability of an innovative and extremely detailed atomistic model to simulate the deposition and transformation of a complex liquid material during a real-world deposition process. Additionally, this model predicts the physical properties of the film after being deposited on a substrate at any given pressure, thus enabling the prediction of the properties of these materials for their intended application. We demonstrate the advantage of the atomistic approach over continuum and molecular dynamics simulation, and we show that it also allows greater prediction of the film structure and properties than small-molecule models used for predictive purposes.
