As an image editor, Photoshop Elements functions like most professional software and as a consumer-oriented program it has a friendly interface, some nice features, and lower prices. As a photo editor, it works well but isn't as robust as professional-level software. It's strong in what it does. With both Elements and Photoshop, you can resize, crop, add text, convert to black-and-white, adjust the brightness, contrast and exposure and apply some special effects. You can also edit images in the raw format used by professional photographers. You can apply some effects to images that result in improved clarity, depth, edges and contrast. Among the tools in Photoshop Elements is a menu called the Layers palette. Layers allow you to work on multiple images or layers at the same time. You can also create layers based on the original photo or image and edit them in different ways. Topics covered in this article: The Layers palette Properties Used to give images special effects Paint Bucket tool Airbrush The Options and Preferences The Palette tool Transforming Adjustment brushes Live filters The Control panel A few other tools Whether you're looking to edit graphics for your website or document a wedding and other photos, Photoshop Elements is a good choice. Features of the Layers palette In the Layers palette you will find tools called tools with icons that look like the word tool in different colors. These tools, called layers, let you edit multiple images or just the original image. You can even create layers based on the original image. Each layer appears in a different color. Clicking a color changes the palette to that color. You can then adjust the color layer as needed. You can adjust a single color by changing its color or setting the Opacity. You can also change the color and the Opacity for multiple colors by selecting them all. You can also change the color, Opacity, and thumbnail size by clicking on the image that appears in the layer box. You can create new layers from scratch by clicking the plus icon. Q: conditional css for input field on change I am trying to use a class on my input field to change the background color. The type is "password". If the password does not meet my criteria the background color should not change. This works fine if you look it on button change. But when I do change on "change" it does not work, why? `$('#pass').on('change', function () { if ($(this).val() !== '') { $('#pass').addClass('cs-pass-invalid'); } else { $('#pass').removeClass('cs-pass-invalid'); } });` A: The problem is that the event you are binding the handler to in your html doesn't exist. Change to `$('#input[type=password]').on('change', function () {` Millions of African Americans descended on Washington to watch President Barack Obama deliver his first major speech on the economy on the West Front of the U.S. Capitol. The raucous demonstration is a virtual replay of the 1960s civil rights march for voting rights, and the Black Lives Matter activists who threw the country into tumult in the wake of the recent police shooting of a black teenager in Baltimore. Black people are now more empowered than ever before. The number of African-Americans on corporate boards rose 23 per cent to 4,788 in 2014, according to a new report from Catalyst, a nonprofit that promotes inclusion of minorities and women. But we are, as Michelle Obama writes, "holding back." Although black Americans make up about 13 per cent of the U.S. population, we are underrepresented in the upper echelons of business, law and government. Among the top 50 law firms, only one had a black female partner — a New York firm with no Chicago representation. Black-led companies made up 1.9 per cent of S&P 100 companies last year, and there are few senior management teams with African-American representation. One bright spot is music, where the top six recording artists, three of them black men, include a country singer.

From FD&C green tea to green tea extract: evidence of the bioactivity of tea in Asia and in the United States. This article will summarize the scientific evidence to evaluate the bioactivity of tea in Asian and American countries. Tea is the most widely consumed beverage in the world, and also has been consumed for thousands of years. The chemistry and pharmacology of tea are quite different in the two regions. Tea in Asia is generally produced with some components and is consumed with certain lifestyle. These components vary, and they contribute to the health benefits of tea. Evidence from a variety of scientific studies show that green tea, white tea, and black tea are excellent sources of antioxidant compounds. Many of the antioxidants in tea contribute to the beneficial effects of tea consumption on human health. For example, epigallocatechin gallate, one of the major catechin compounds in green tea, has potent biological activity such as anti-inflammatory and anti-cancer activity. A variety of tea components, especially antioxidants, are still being studied. Differences in the chemical components of Asian tea, including the processing method, is of scientific and clinical importance. The most bioactive components in tea are more likely to come from tea leaves from specific regions such as China or India. More research is still needed to confirm the benefits of tea components, particularly their therapeutic potential.
