To investigate the clinical features and surgical management of children with intestinal lymphangiectasia (IL). Retrospective analysis of 5 children with IL admitted to the Paediatric Department of the Second Hospital of Hebei Medical University between March 2007 and July 2013. All patients had a history of small intestinal resection with severe diarrhea as the chief clinical symptom. Most children had a history of other systemic anomalies. At first, the abnormal anatomy and function of the lymphatic system were diagnosed by gastrointestinal X-ray or by surgical exploration. Malabsorption was primarily suspected in 4 cases. Six months or even 1 year later, segmental and/or complete excision was performed for the affected intestine. Postoperative pathologic examination confirmed the diagnosis of lymphangiectasia. In 2 patients with obvious local malformation of the intestine, primary resection or intestinal-duodenal transplantation was performed. 1 case of intestinal lymphangiectasia had some congenital abdominal hernia. All children were followed up for 3 to 60 months. Most patients had a good general condition after resection. The patients who underwent intestinal-duodenal transplantation suffered from graft rejection, but recovered when using immunosuppressive agents. Surgery is a reliable treatment for children with IL.Menu Whose fault is it? Who is responsible for this? In the past, I gave a fairly decent answer, but let's re-think that.
