User's Manual.Q: Method(s) for calculating heuristic move scores for chess engines Would like to develop a chess engine that can apply a heuristic in calculating its move scores for the opponent's games. I understand that a heuristic can be defined as anything that doesn't guarantee a correct result, but what aspects of the game can be used as an input for such a definition? A: If you want to do it "correctly" you should start with this: What is heuristic algorithm? For my understanding most chess engines are based on the following ideas
