It is Multi OS work.Heart valve disease, i.e., damage or disease of heart valves, occurs when the valves of the heart (the four valves) do not function properly. Valve dysfunction may result from congenital malformations, rheumatic fever or other inflammatory processes, viral infections, or trauma. Damage to the valves can result in regurgitation or backflow of blood through the valve during the systolic phase of the heart cycle. A valve that leaks blood or regurgitates during systole will not close during diastole to prevent further backflow or regurgitation. Backflow or regurgitation often becomes more severe with age as the leaflets of a valve stiffen and enlarge, further resulting in poor valve function, heart disease, and ultimately death. Implantable devices, such as replacement heart valves, may be designed to function with less energy consumption than do native heart valves. Some commercially available replacement valves require an average 10 W or more of electrical power. Electrical valves may decrease energy consumption by more than half (e.g., to 4 W or lower). Replacement valves may be implanted below a patient's skin, inside a patient's jawbone or elsewhere, replacing the need for opening a patient's chest cavity or heart. An implantable valve replacement device may use an energy source. For example, the implantable valve may be coupled d0c515b9f4
